chard_wuebker@berkeley.eau-ren 20. MFE Math Foundations Assignment 5 Solutions

(b) We have

not equivalent measures, since
$$\mathbb{Q}(\omega_2)=0\neq \mathbb{P}(\omega_2)$$
. We have
$$\frac{i}{\frac{d\mathbb{Q}}{d\mathbb{P}}(\omega_i)} \frac{1}{0.25} \frac{2}{0} \frac{3}{5} \frac{4}{1}$$

2. A random variable $X:\Omega\to\mathbb{R}$ is \mathcal{F} -measurable if for all $a\in\mathbb{R},$ we have

$$X^{-1}((a,\infty)) \in \mathcal{F}$$

$$X^{-1}((4,\infty)) = \{\omega \in \Omega \mid X(\omega) > 4\} = [0,\infty) \notin \mathcal{F}$$

2. A random variable
$$X:\Omega\to\mathbb{R}$$
 is \mathcal{F} -measurable if for all $a\in\mathbb{R}$, we have
$$X^{-1}((a,\infty))\in\mathcal{F}$$
 Here we are using the notation $X^{-1}(E)=\{\omega\in\Omega\mid X(\omega)\in E\}$. However, note that we have
$$X^{-1}((4,\infty))=\{\omega\in\Omega\mid X(\omega)>4\}=[0,\infty)\notin\mathcal{F}$$
 Thus, this X is not \mathcal{F} -measurable.

3. (a) For $I_t\equiv k$, we have
$$V_T=\mu\int_0^Tk\,dt+\sigma\int_0^Tk\,dW_t\\ =\mu kT+\sigma k(W_T-W_0)\\ =\mu kT+\sigma kW_T$$
 (b) We compute
$$\mathbb{E}[V_T]=\mu kT$$

$$\mathbb{E}[V_T] = \mu kT$$

.48:34 PM PST

$$Var[V_T] = \sigma^2 k^2 Var[W_T] = \sigma^2 k^2 T$$

$$U(k) = \mu kT - \frac{\gamma}{2}\sigma^2 k^2 T$$

 $U(k)=\mu kT-\frac{\gamma}{2}\sigma^2k^2T$ The first order condition is $0=U'(k)=\mu T-\gamma\sigma^2kT$, and $U''(k)=-\gamma\sigma^2T<0$ so a unique maximum exists. Solving the equation from the first order condition, we get the solution $k=\frac{\mu}{\gamma\sigma^2}$

$$k = \frac{\mu}{\gamma \sigma^2}$$

4. Note that

2021 9:48:34 PM PST

$$k=rac{\mu}{\gamma\sigma^2}$$
 $X_t=X_0+\mu t+\sigma W_t,$

from class. Ito's lemma for the function
$$H(X_t)=X_t^3$$
 gives us
$$dH=3X^2\,dX+\frac{1}{2}6X(dX^2)$$

$$=3X^2(\mu dt+\sigma dW)+3X\sigma^2\,dt$$

$$=3X(\mu X+\sigma^2)dt+3X^2\sigma dW.$$

Thus,

2021 9:48:34 PM PST

$$dH = 3X^{2} dX + \frac{1}{2} 6X(dX^{2})$$

$$= 3X^{2} (\mu dt + \sigma dW) + 3X\sigma^{2} dt$$

$$= 3X(\mu X + \sigma^{2}) dt + 3X^{2} \sigma dW.$$

$$Q = \int_{0}^{T} dH = H(T) - H(0)$$

$$= X_{T}^{3} - X_{0}^{3}$$

$$= (X_{0} + \mu T + \sigma W_{T})^{3} - X_{0}^{3}.$$

$$C(t, W_{0}) = (X_{0} + \mu T + \sigma W_{T})^{3} \text{ then } Q = C(T, W_{T}) - C(0, W_{0})$$

 $=X_T^3-X_0^3$ $\equiv (X_0+\mu T+\sigma W_T)^3-X_0^3.$ Also, note that if we define $G(t,W_t)=(X_0+\mu T+\sigma W_T)^3,$ then $Q=G(T,W_T)-G(0,W_0).$
